1. Description

1.1 Principle of the MACS® Separation

First, the CD271⁺ cells are magnetically labeled with CD271 MicroBeads. Then, the cell suspension is loaded onto a MACS® Column, which is placed in the magnetic field of a MACS Separator. The magnetically labeled CD271⁺ cells are retained within the column. The unlabeled cells run through; this cell fraction is thus depleted of CD271⁺ cells. After removing the column from the magnetic field, the magnetically retained CD271⁺ cells can be eluted as the positively selected cell fraction. To increase the purity, the positively selected cell fraction containing the CD271⁺ cells must be separated over a second column.

1.2 Background information

CD271, also known as LNGFR (low-affinity nerve growth factor receptor) or p75NTR, belongs to the low-affinity neurotrophin receptor and the tumor necrosis factor receptor superfamily. CD271 is a well-known marker on mesenchymal stem cells, also known as mesenchymal stromal cells (MSCs), from bone marrow aspirate or liposapirate. After separation colony-forming unit fibroblast (CFU-F) activity was found only in the CD271⁺ cell fraction, and not in the CD271⁻ population. Isolated CD271⁺ cells have a higher proliferative capacity in comparison to MSCs isolated by plastic adherence. CD271 (LNGFR) was initially described to be expressed on cells of the central and peripheral nervous system nervous system and was suggested to be involved in the development, survival, and differentiation of neural cells. CD271 neural crest progenitor cells can be efficiently isolated with Neural Crest Stem Cell MicroBeads.

1.3 Applications

- Positive selection or depletion of CD271⁺ MSCs, e.g., from bone marrow or liposapirate.

1.4 Reagent and instrument requirements

- Buffer: Prepare a solution containing phosphate-buffered saline (PBS), pH 7.2, 0.5% bovine serum albumin (BSA), and 2 mM EDTA by diluting MACS BSA Stock Solution (# 130-091-376) 1:20 with autoMACS® Rinsing Solution (# 130-091-222). Keep buffer cold (2−8 °C). Degas buffer before use, as air bubbles could block the column.
  ▲ Note: EDTA can be replaced by other supplements such as anticoagulant citrate dextrose formula-A (ACD-A) or citrate phosphate dextrose (CPD). BSA can be replaced by other proteins such as human serum albumin, human serum, or fetal bovine serum (FBS). Buffers or media containing Ca²⁺ or Mg²⁺ are not recommended for use.
MACS Columns and MACS Separators: CD271+ cells can be enriched by using MS or LS Columns or depleted with the use of LD Columns. Cells which strongly express the CD271 antigen can also be depleted using MS or LS Columns. Positive selection or depletion can also be performed by using the autoMACS Pro or the autoMACS Separator.

**Note:** Column adapters are required to insert certain columns into the VarioMACS™ or SuperMACS™ II Separators. For details refer to the respective MACS Separator data sheet.

(Optional) Fluorochrome-conjugated antibodies for flow cytometric analysis, e.g., CD271 (LNGFR)-PE, CD271 (LNGFR)-APC, or CD45-FITC. For more information about antibodies refer to www.miltenyibiotec.com/antibodies.

**Note:** There is no column for MS Columns and LS Columns, the use of LD Columns, or the use of autoMACS Pro for the positive selection or depletion of CD271+ cells.

**2. Protocol**

**2.1 Sample preparation**

When working with anticoagulated peripheral blood or buffy coat, peripheral blood mononuclear cells (PBMCs) should be isolated by density gradient centrifugation, for example, using Ficoll-Paque®. Dead cells may bind non-specifically to MACS MicroBeads. To remove dead cells, we recommend using density gradient centrifugation or the Dead Cell Removal Kit (# 130-090-101).

**2.2 Magnetic labeling**

**Note:** Work fast, keep cells cold, and use pre-cooled solutions. This will prevent capping of antibodies on the cell surface and non-specific cell labeling.

**Volumes for magnetic labeling given below are for up to 10⁷ total cells. When working with fewer than 10⁷ cells, use the same volumes as indicated. When working with higher cell numbers, scale up all reagent volumes and total volumes accordingly (e.g. for 2×10⁷ total cells, use twice the volume of all indicated reagent volumes and total volumes).**

**For optimal performance it is important to obtain a single-cell suspension before magnetic labeling. Pass cells through 30 µm nylon mesh (Pre-Separation Filters, 30 µm # 130-041-407) to remove cell clumps which may clog the column. Moisten filter with buffer before use.**

**The recommended incubation temperature is 2–8 °C. Higher temperatures and/or longer incubation times may lead to non-specific cell labeling. Working on ice may require increased incubation times.**

If CD271+ MSCs are intended to be taken into culture, it is recommended to start with at least 2×10⁷ bone marrow mononuclear cells (BM MNCs) in order to obtain sufficient cell numbers for subsequent cultivation of CD271+ cells.

1. Determine cell number.
2. Centrifuge cell suspension at 300×g for 10 minutes. Aspirate supernatant completely.
3. Resuspend cell pellet in 60 µL of buffer per 10⁷ total cells.
4. Add 20 µL of FcR Blocking Reagent and 20 µL of CD271 MicroBeads per 10⁷ total cells.
5. Mix well and incubate for 15 minutes in the refrigerator (2–8 °C).
6. If CD271+ MSCs are intended to be taken into culture, it is recommended to start with at least 2×10⁷ bone marrow mononuclear cells (BM MNCs) in order to obtain sufficient cell numbers for subsequent cultivation of CD271+ cells.

When working with tissues or lysed blood, prepare a single-cell suspension using standard methods. For details refer to the protocols section at www.miltenyibiotec.com/protocols.
2.3 Magnetic separation

▲ Choose an appropriate MACS Column and MACS Separator according to the number of total cells and the number of CD271⁺ cells. For details refer to the table in section 1.4.

▲ Always wait until the column reservoir is empty before proceeding to the next step.

Magnetic separation with MS or LS Columns

1. Place column in the magnetic field of a suitable MACS Separator. For details refer to the respective MACS Column data sheet.

2. Prepare column by rinsing with the appropriate amount of buffer:
   - MS: 500 µL
   - LS: 3 mL

3. Apply cell suspension onto the column. Collect flow-through containing unlabeled cells.

4. Wash column with the appropriate amount of buffer. Collect unlabeled cells that pass through and combine with the flow-through from step 3.
   - MS: 3×500 µL
   - LS: 3×3 mL

▲ Note: Perform washing steps by adding buffer aliquots only when the column reservoir is empty.

5. Remove column from the separator and place it on a suitable collection tube.

6. Pipette the appropriate amount of buffer onto the column. Immediately flush out the magnetically labeled cells by firmly pushing the plunger into the column.
   - MS: 1 mL
   - LS: 5 mL

7. (Optional) To increase the purity of CD271⁺ cells, the eluted fraction can be enriched over a second MS or LS Column.

▲ Note: For subsequent cell culture CD271⁺ MSCs can be eluted in 1 mL StemMACS MSC Expansion Media (Order no. 130-091-680). For seeding densities in CFU-F assays or MSC expansion culture refer to table 1.

2.4 Autolabeling and separation using the autoMACS® Pro Separator

▲ Refer to the respective user manual for instructions on how to use the autoMACS® Pro Separator.

▲ Buffers used for operating the autoMACS Pro Separator or the autoMACS Separator should have a temperature of ≥10 °C.

▲ For appropriate resuspension volumes and cell concentrations, please visit www.automacspro.com/autolabeling.

2.4.1 Autolabeling with the autoMACS® Pro Separator using the 2D code reader

1. Prepare and prime the instrument.

2. Go to the Reagent menu and highlight the position where the reagent vial will be placed in the MACS Reagent Rack. Four positions are available.

3. Select Read Reagent to activate the 2D code reader.

4. Present the vial in front of the 2D code reader.

5. Select reagent name appearing on screen.

6. After scanning the vial, the next available MACS Reagent Rack position will be automatically highlighted.

7. Insert the vial into the appropriate rack position.

8. Proceed to magnetic separation (2.4.2).

2.4.2 Magnetic separation

1. Highlight the desired position(s) in the sample separation template.

2. Apply tube containing the sample and provide tubes for collecting the labeled and unlabeled cell fractions. Place sample tube in row A of the tube rack and the fraction collection tubes in rows B and C.

3. Choose reagent name from the labeling submenu.

4. (Optional) The recommended cell separation and wash program will be automatically displayed after choosing the program. It is possible to change the separation program or the wash program between samples or to assign the Sleep program after finishing the last sample. Highlight the desired cell separation and wash program in the Separation and Wash submenus, respectively.

5. Insert sample volume in the Volume submenu using the numeric keypad.

6. Select Run to start the cell separation.
3. Example of a separation using the CD271 MicroBead Kit

CD271⁺ cells were isolated from 1×10⁷ bone marrow mononuclear cells (BM MNCs) by positive selection using two MS Columns. CD271⁺ cells were detected based on CD271 (LNGFR)-PE labeling and counterstaining with CD45-FITC. Cell debris and dead cells were excluded from the analysis based on scatter signals and propidium iodide fluorescence. Among the isolated CD271⁺ cells, the gated CD45⁻ fraction exhibits clonogenic potential in CFU-F assay, whereas the CD45⁺ fraction shows no proliferation in culture and will be lost during passaging.

4. References

Warnings

Reagents contain sodium azide. Under acidic conditions sodium azide yields hydrazoic acid, which is extremely toxic. Azide compounds should be diluted with running water before discarding. These precautions are recommended to avoid deposits in plumbing where explosive conditions may develop.
